

Read About the MultiAd Creator 6.0.6 Updater

April 9, 2002

Updating Instructions

1. Download the Creator 6.0.6 Updater by clicking the "Download Update for Macintosh" link.
2. Double-click the Creator 6.0.6 Updater icon that appears on your desktop.
3. Click Continue in the Read Me window.

Note: Before you click Install, you should know that the updater will search for the old version of the application to update. By default it will search the Applications folder on the startup drive and its subfolders. If you have installed on another drive or in somewhere other than the default location, use the Install Location popup menu to choose another drive or another folder to start the search from.

4. Click Install. If multiple copies of previous versions of Creator are found, you will be asked to choose which one to update.
5. After a dialog box appears telling you that the installation was successful, click Quit. Some users may be prompted to restart.

If installation was unsuccessful: Try one or more of the following:

- Click Select Folder in the Install Location popup menu, and then choose the exact folder that contains the Creator application.
- Turn off Extensions and repeat the preceding steps.
- Reinstall MultiAd Creator 6.0.1, 6.0.2, 6.0.3, or 6.0.5 and repeat the preceding steps.

Note about AppleScripts:

The Creator 6.0.6 Updater will replace all AppleScripts that have changed since the 6.0.1 release. If you have modified an AppleScript yourself, you should copy your modified version elsewhere before running the installer. Then you can check your version against the new one to see which one you want to use, or to make your modifications to the new version.

Version 6.0.6 Improvements

- Fixed a bug that could affect saving to any kind of server. Two or more people can now successfully save Creator files to the same server volume at the same time.

Version 6.0.5 Improvements

- Two new scripts were added to the Bookmarks submenu under the Script Menu: "Go to Bookmark" and "Set Bookmark on Spread."
- Style models imported from Creator Classic documents now work correctly.
- Illustrator EPS files with a fill of none now preview correctly.
- Creator 6 no longer crashes when importing some EPS files made by CorelDraw 10.

- In Mac OS 9, exporting a GIF file using Black & White as Export color now works correctly.
- In Mac OS X, conversion of Borders from Creator Classic to Creator 6 now works correctly.
- Several other bugs were fixed.

Version 6.0.3 Improvements

- Mac OS X (10.1) compatibility
- Improved stability (many bugs fixed)
- Faster in some areas
- Compatible with a wider range of printers
- Smaller PDF files
- Overflowed text is signified by three red dots in inactive text blocks.
- Photo Border is a new script that has been added to the Graphics Suite submenu under the Script Menu. This script creates a thick white border around a selected graphic.
- The Creator Migration Tool 6.0.3 has three new features:
 - 1) It converts EPSF graphics to EPSP graphics so their previews can be displayed by Creator 6 Windows.
 - 2) It fixes illegal file and folder names.
 - 3) It lets you specify a mirror directory for converted Creator 4 files and their graphics.
